

What is claimed:

1. A power supply controller of a combined electronic equipment comprising:  
a power supply portion for supplying voltages having a plurality of different levels to a plurality of functional blocks to which power is independently supplied; and  
a control portion for controlling the power supply portion;

wherein said control portion comprises deciding means for deciding as to whether operation of any of the functional blocks is selected, and control means for controlling said power supply portion for stopping the supply of a voltage having a level corresponding to the non-selected functional block in response to the result of decision.

2. The power supply controller of the combined electronic equipment according to Claim 1, wherein the control portion is one of the functional blocks.

3. The power supply controller of the combined electronic equipment according to Claim 1, wherein the decision means makes decision by selection information based on selecting operation by an operator.
